NOTE: After each county list (except Jefferson, Montrose, and Pitkin Counties) is a graph and table of oil, gas, coalbed methane, and/or carbon dioxide production covering the years 1980–1996.

INTRODUCTION

Information Series 47 is presented as an update and revision of a previous Colorado Geological Survey publication; Information Series 18 authored by A. H. Scanlon in 1981.

Statistical data contained in this publication are presented in columnar format and include all currently producing, shut in, and abandoned oil and gas fields on record with the Colorado Oil and Gas Conservation Commission (COGCC). These data are listed in section **Production Statistics by County and Field** in alphabetical order by county and by fields within each county (column 1). The field location (column 2) is listed by township and range. Fields within the New Mexico and Ute Principal Meridians include the additional designation of either (NM) or (Ute) respectively. Fields within the Sixth Principal Meridian have no designation. Fields located in two or more counties include a reference to the other county(ies). Column 3 states the year of discovery and where applicable the year of abandonment. The number of field wells producing or capable of producing from an individual pay zone or formation are listed in column 4. Column 4 also includes a count of those field wells in which production from two formations is commingled. Column 5 lists

the producing formations in an abbreviated format. Pages 3 through 11 include an explanation of the formation abbreviations, the lithologic character of the producing formation and the age of the producing formation.

Cumulative oil production through December 1996 for each field reservoir and commingled reservoirs are listed in column 6. Column 7 lists cumulative gas production through December 1996 for individual and commingled reservoirs.

Column 8 and 9 reports field cumulative oil and gas production, respectively, through December 1996. For those fields located in two or more counties the cumulative total is only listed for the county with the major component of the field's production. Finally, column 10 reports on the number of wells plugged and abandoned for individual and commingled reservoirs. Additional details on production data by operator or lease within each field can be obtained from COGCC annual publications entitled *Oil and Gas Statistics*. This publication is normally released approximately 8 months after the end of the year's production being reported on.

Historically thirty-six of Colorado's 63 counties have produced oil and thirty-nine counties have produced natural gas. At the

end of each county list is a bar graph and table which reports that county's annual gas and oil production from 1980 to 1996. There is a coalbed methane (CBM) bar graph and table for seven of the counties.

The section, **State and Regional Production Statistics**, which precedes the county and field list, consists of a list of abbreviations used in the tables and graphs, an index map of Colorado with counties and boundaries of the four principal geological producing regions (Piceance Creek Basin and Sand Wash Basin region, Paradox Basin and San Juan Basin region, Las Animas Arch region, and Denver Basin region), a graph of annual active well counts from 1960 to 1996, graphs and tables on annual statewide production of oil and natural gas from 1960 to 1996, graphs and tables on annual production from 1980 to 1996 for the four principal geological producing regions of the state, and a list of cumulative annual production for the state's 25 largest oil and gas fields.

The senior author of this publication, Allison Lawson, compiled the county data from the COGCC 1996 *Oil and Gas Statistics* volume. The junior author of this publication, H. Thomas Hemborg, edited the compilation of county production data

and prepared the accompanying charts, graphs, and formation descriptions.

The authors would like to thank the staff of the CGS who provided assistance and helpful advice during the course of this compilation. We are particularly

grateful to Cheryl Brchan who single handedly prepared the manuscript for submittal to the printer for publication.

The authors assume full responsibility for any errors or omissions in these tabulations.

This publication was funded by the Colorado Department of Natural Resources Severance Tax Operational Fund. Severance taxes are derived from production of oil, gas, coal, and minerals.

PRODUCING FORMATIONS/ HORIZONS IN COLORADO

| Formation | Description | Age |
|--------------------------|---|--|
| Atokan Group | Atokan strata of eastern Colorado consist primarily of dark-gray to black shales and lime mudstones and wackstones. Near the ancestral Apishapa uplift of eastern Las Animas County the sequence includes interbedded arkosic sandstones derived from the Apishapa high. | Middle Pennsylvanian (Atokan Series) |
| Barker Creek | A carbonate cycle of the Paradox Formation of southwestern Colorado. Barker Creek reservoirs are reef-mound buildups of platy-algae and foraminiferal carbonate packstone and grainstone that locally can be highly dolomitized. | Pennsylvanian (Desmoinesian Series) |
| Burro Canyon | Heterogeneous sequence of conglomerate, sandstone, shale, and thin lenses of limestone | Lower Cretaceous |
| Cedar Mountain Formation | White, gray, and red sandstone and conglomerate with interbedded green and purplish shale deposited under fluvial conditions. The sandstone beds are massive, irregular, and lenticular. Crossbedding and festoon bedding are prevalent throughout the formation. | Lower Cretaceous |
| Cherokee Group | The Cherokee Group consists of gray and black shale that is interbedded with arkosic sandstone and occasional thin-bedded carbonate mudstones and wackstones. | Middle Pennsylvanian (Desmoinesian Series) |
| Codell Sandstone | The Codell Sandstone, a development target in the Wattenberg area of the Denver Basin, is a poorly sorted, clayey to silty, very fine- to medium-grained sandstone that has been extensively bioturbated. It is a unconformity-bounded unit that was deposited below normal, fair-weather wave base on a broad shelf of the Cretaceous interior seaway. | Upper Cretaceous |
| Curtis Formation | Fine-grained glauconitic sandstone, gray-green calcareous shale, and occasional thin bedded oolitic limestone stringers. | Middle and Upper Jurassic |
| Cutler Formation | Complex assemblage of interbedded, coarse, red and pink, arkosic granite-wash sandstone; black, purple, red, maroon, green, and brown micaceous silty shale; tan finely crystalline limestone; and orange-red, micaceous sandy arkosic siltstone. The productive lithology is the arkosic granite-wash sandstone in the lower half of the 2,000 to 6,000-foot-thick Cutler Formation. | Lower Pennsylvania-Upper Permian |

| Formation | Description | Age |
|---|--|--|
| D Sandstone | Composed of two units. The lower unit is a fine-grained, well-sorted sand of delta front, shoreline, or marine bar origin. The second or younger unit is a fine grained, well-sorted , cross-stratified sandstone that accumulated as part of a valley fill. | Upper Cretaceous |
| Dakota, Dakota Formation, or Dakota Sandstone | The Dakota lies stratigraphically between the Jurassic Morrison and the Upper Cretaceous Graneros or Mowry Shale. Due to the stratigraphic complexities of the group, correlation regionally is difficult and the resulting nomenclature is burdensome. The pay zone designated as the Dakota Sandstone or Dakota Formation in western Colorado includes the package of sandstone and shale that lies below the Mowry Shale and above the Jurassic Morrison and where present above the Lower Cretaceous Burros Canyon Formation. In the Denver Basin the Dakota Sandstone or Dakota has come to mean the Plainview Sandstone Member of the South Plate Formation and Lytle Formation of the Dakota Group as described in the classic outcrops in the foothills of the Front Range west of Denver. | Upper and Lower |
| Desert Creek Cycle | A carbonate cycle of the Paradox Formation of southwestern Colorado. Desert Creek reservoirs are reef mound buildups of platy-algae carbonate packstone and grainstone | Pennsylvanian (Desmoinesian Series) |
| Douglas Creek Member of the Green River Formation | Primarily organic-rich lacustrine shales with occasional sandstone interbeds. Production is from sands at or near the base of the unit. | Tertiary (Eocene Epoch) |
| Entrada Sandstone | Reddish-orange to grayish-orange to pink, large-scale crossbedded and planar bedded, fine- to medium-grained sandstone. Dominantly eolian | Middle Jurassic |
| Fort Scott Limestone | Marine shelf sequence consisting of interbedded limestones and gray shale. Basal unit of Marmaton Group | Middle Pennsylvanian (Desmoinesian Series) |
| Fort Union Formation | Interbedded black to greenish-gray shales and light brown to gray sandstones, some thin coal bed stringers, and dark gray to light brown limestones. Depositional environments of the nonmarine Fort Union were alluvial, paludal, lacustrine, and fluvial. | Tertiary (Paleocene) |
| Fox Hills Sandstone | Interbedded gray, fine- to very fine-grained sandstone and gray sandy calcareous shales. The Fox Hills is the uppermost regressive sandstone of the Cretaceous System deposited during the final marine withdrawal from the Rocky Mountain area. | Upper Cretaceous |
| Frontier Formation | Interbedded fine- to medium-grained, light gray, slightly siliceous sandstone and dark gray silty shale with rare white bentonite stringers | Upper Cretaceous |
| Fruitland Formation | The Fruitland Formation of southwestern Colorado consists of alternating gray to brown sandstone, black shales, and coal beds. It is interpreted as a nonmarine, lower coastal plain sequence. When identified as a producing reservoir in the San | Upper Cretaceous |

| Formation | Description | Age |
|---------------------------------|--|---|
| Fruitland Formation (continued) | Juan Basin by operators it is informally understood that production is limited to the unit's sandstones. | |
| Fruitland Coal | Coal beds or seams in the Fruitland Formation that are productive of coalbed methane | Upper Cretaceous |
| Gallup Sandstone | The productive Gallup Sandstone in the Colorado portion of the San Juan Basin are basal transgressive marine sands within the lowermost Niobrara Formation. This Niobrara Formation member lies on a regional unconformity that developed on top of the underlying Carlile Shale during a sea level fall. This productive zone should actually be identified as the Tocito Sandstone. The "true" Gallup Sandstone of northwestern New Mexico is older and lies within the Carlile Shale and is believed to have been deposited as strike valley sands. | Upper Cretaceous |
| Greenhorn Limestone | The deposition of the Greenhorn Limestone took place during the maximum inundation of the western interior by the Cretaceous seaway. This interbedded sequence of limestone and black shale attains a thickness of 300 ft in the north central part of the state. The unit thins southward to 150–200 ft in southwestern Colorado, to less than 150 ft in southeastern Colorado, and to a zero edge in the northwestern part of the state. | Late Cretaceous |
| Hermosa Group | The Hermosa Group of southwestern Colorado includes three formations which in ascending order are the Pinkerton Trail, Paradox and Honaker Trail. The Pinkerton Trail is comprised of gray, mixed skeletal lime to dolomite wackstones and packstones and black to dark gray shale. A description of the Paradox Formation is given later in this section. The Honaker Trail is similar in most respects to the Pinkerton Trail except that the Honaker Trail also includes a minor component of sandstone. | Middle and Upper Pennsylvanian |
| Honaker Trail | Consists of 2,000 to 3,000 feet of thin, gray-buff limestone, gray shale, and gray-white sandstone deposited in a relatively shallow, marine environment in the Paradox Basin of southwestern Colorado | Upper Pennsylvanian |
| Ismay Cycle | A carbonate cycle of the Paradox Formation of southwestern Colorado. Ismay reservoirs are reef mound buildups of platy-algae carbonate packstone and grainstone. | Pennsylvanian (Desmoinesian Series) |
| Kansas City Group | Marine shelf sequence consisting of interbedded limestones, sandstones, and shales | Upper Pennsylvanian (Missourian Series) |
| Keyes Sandstone Member | Primarily a coarse-grained, subrounded to angular, calcareous sandstone with poor to good porosity. Includes interbeds of white to brown, medium to coarsely crystalline, bioclastic, and glauconitic limestone. | Lower Pennsylvanian (Morrow Series) |

| Formation | Description | Age |
|--|--|--|
| Kirtland Shale (Farmington Sandstone Member) | The Farmington Sandstone Member of the Kirtland Shale is a sequence of nonmarine gray shale and fine-grained channel sandstones | Upper Cretaceous |
| Lakota Formation | Gray, fine- to coarse-grained sandstone with chert pebbles. In Colorado this common Wyoming unit is restricted to the North Park Basin. | Lower Cretaceous |
| Lance Formation | Lance Formation reservoirs are highly discontinuous, fluvial-dominated sandstones that occur in a sequence of lacustrine shales and overbank siltstones and shales. Includes lenticular subbituminous coal beds. | Upper Cretaceous |
| Lansing Group | Marine shelf sequence consisting of interbedded limestones, sandstones and gray shales | Upper Pennsylvanian (Missourian Series) |
| Leonard sequence | Alternating limestone/siliciclastic sequence. The limestones are characterized by both primary inter-particle and moldic porosity, a paucity of associated dolomites and evaporites, and terrigenous siltstones and fine-grained sandstones capping the depositional cycles. | Lower Permian |
| Lewis Shale | Gray marine shale that in northwestern Colorado includes sandstone reservoirs that were deposited as discontinuous lobate submarine fans | Upper Cretaceous |
| Lyons Sandstone | Moderate orange to pink to pinkish gray, fine- to medium-grained, firmly cemented, well sorted, cross-stratified, quartzose sandstone | Permian |
| Mancos Shale | The Mancos Shale is a thick complex of interbedded and interlaminated claystone, siltstone, and fine sandstone that was deposited in a marine environment. Includes lower Pierre, Niobrara, Benton, Frontier, and Mowry equivalents | Upper Cretaceous |
| Marmaton Group | The Marmaton Group consists of gray and black shale that is interbedded with arkosic sandstones and occasional carbonate mudstones and wackstones. | Middle Pennsylvanian (Desmoinesian Series) |
| McClave Sandstone | Morrow valley-fill sandstone that is productive in the McClave gas field of southeastern Colorado | Lower Pennsylvanian (Morrow Series) |
| Mesaverde Group | In southwestern Colorado this interval includes in ascending order the following pay zones that have been identified by some operators of the region's individual fields: Point Lookout Sandstone, Menefee Formation and the Cliff House Sandstone. In northwest Colorado this interval is includes in ascending order the following pay zones that have identified by some operators of this region's individual fields: Emery, Morapos, Castlegate, Corcoran, Cozzette , Rollins Sandstone, and the Williams Fork Formation. In northwest Colorado Mesaverde coalbed methane production includes the Cameo and Williams Fork coal seams that have been identified by some operators in the region's individual fields. | Upper Cretaceous |

| Formation | Description | Age |
|--------------------------------|---|--|
| Mesaverde Group (continued) | The Mesaverde coastal-plain and near-shore marine sands, shales and coal of northwestern Colorado are younger than the Mesaverde of southwest Colorado. Within the context of nonmarine-marine cycles; however, they are considered to be part of the same interval. | |
| Minturn Formation | Thick sequence of grit, conglomerate, sandstone, and shale, and intercalated beds of carbonate rocks, predominantly gray but red in upper part. The clastic rocks that make up the bulk of the formation are varied but in general are arkosic, coarse grained, and poorly sorted | Middle Pennsylvanian |
| Mississippian | Generally the Mississippian strata of Colorado are dominated by open circulation, shallow-subtidal carbonates in northwestern, southwestern, and eastern Colorado, which changes facies to near-shore subtidal and intertidal carbonate deposits and some sandstones in proximity to the uplift areas in central and southwestern Colorado. | Mississippian |
| Moenkopi Formation | Red and green siltstone, light gray and green mottled shale and fine-grained sandstone | Lower Triassic |
| Molas Formation | Interbedded red siltstones, sandstones, light colored limestones and varicolored shales. The basal portion of the Molas is a reworked regolith formed on a Mississippian karst surface. | Lower Pennsylvanian |
| Morrison Formation | Variegated shale and siltstone with variable amounts of sandstone; minor thin beds of limestone. A nonmarine to very shallow, low energy marine sequence noted for its vertebrate fauna | Upper Jurassic |
| Morrow Group | The Morrow consists largely of shallow-water marine mudstone. Medium to coarse grained, fluvial valley-fill sandstone deposits that are genetically related to sealevel drops occur throughout the Morrow. Morrow reservoirs are exclusively the valley-fill sands. | Lower Pennsylvanian (Morrow Series) |
| Muddy (J) | Composed of two members. The lower Fort Collins Member is a fine-grained, upward-coarsening sandstone of delta front and nearshore marine origin. The overlying Horsetooth Member is mainly a sequence of fine- to medium-grained, well-sorted, cross-stratified sandstones, siltstones and mudstones of fresh- and brackish-water channel origin. A large part of the oil and gas production in the Denver Basin is obtained from the Muddy (J) sandstones. The Muddy (J) is included in the Dakota Group. | Lower Cretaceous |
| Nacimiento Formation | Nonmarine, drab gray, variegated red, olive and yellow bentonitic mudstones interbed with trough-crossbedded sandstones. | Paleocene |

| Formation | Description | Age |
|-------------------------------------|--|-------------------------------------|
| Navajo Sandstone | The Navajo consists chiefly of gray to tan to red, cross-stratified sandstone associated with thinly bedded, horizontally stratified sandstone and minor amounts of lenticular limestone and gypsum. Cross-stratified portions are of eolian origin while lime and gypsum beds were laid down in desert-lake and inland-sabkha environments. In northwest Colorado these rocks are referred to also as the Nugget Sandstone | Lower Jurassic |
| Neva Limestone | Marine shelf sequence consisting of interbedded limestone and gray shale. Basal unit of Council Grove Group. | Lower Permian (Wolfcamp Stage) |
| Niobrara Formation. | The Niobrara Formation in the Denver Basin consists of alternating chalks and organic rich calcareous shales. It is divided into two members: the Fort Hays Limestone Member at the base of the formation and the overlying Smoky Hill Member. | Upper Cretaceous |
| Nugget Sandstone | The Nugget Sandstone consists chiefly of gray to tan to red, cross-stratified sandstone associated with thinly bedded, horizontally stratified sandstone and minor amounts of lenticular limestone and gypsum. Cross-stratified portions are of eolian origin while lime and gypsum beds were laid down in desert-lake and inland-sabkha environments. In northwest Colorado these rocks are referred to also as the Navajo Sandstone. | Lower Jurassic |
| Ohio Creek Member | Light gray, fine- to coarse-grained sandstone with scattered light gray, red and brown chert pebbles. | Upper Cretaceous |
| Osage Group | The Osagean strata of eastern Colorado are restricted to the subsurface and are not well described in the literature. They include subtidal lime and dolomite, sponge-spicule-rich and crinoidal mudstones and wackstones, and crinoidal mudstones and wackstones, and crinoidal lime grainstones and packstones in the upper part of the unit. | Mississippian (Osage Series) |
| Paradox Formation | Interbedded salt, anhydrite, limestone, dark dolomite, and black shale. Originally the name Paradox Formation was given to the evaporite facies of the Pennsylvanian in the Paradox Basin. More recently the term has been informally expanded to include most of the cyclical carbonate facies that is a lateral equivalent to the evaporate section around the basin margins. These are, in descending order, Ismay, Desert Creek, Akah, and Barker Creek. | Pennsylvanian (Desmoinesian Series) |
| Permian (Nina View field reservoir) | Pale reddish-brown platy siltstone and fine-grained sandstone | Permian |
| Phosphoria Formation | Interbedded orange siltstone, bright orange and red shale, thin-bedded oolitic dolomite and anhydrite | Permian |

| Formation | Description | Age |
|----------------------------|---|--|
| Pictured Cliffs Sandstone | Fine- to medium-grained sandstone deposited in a regressive shallow near shore neritic to paralic-littoral environment. Specific depositional facies recognized in this unit include those of delta front, barrier bar, shoreface, and alternating shoreface and estuarine environments. | Upper Cretaceous |
| Pierre Shale | Thick, dark gray shale of central and eastern Colorado. The unit includes six interbedded sandstone, siltstone, and shale sequences (Sharon Springs, Shannon, Sussex, Rocky Ridge, Larimer, and Richard) in the Denver Basin. The Sussex, Shannon and Richards sands are productive in the western portion of the Denver Basin. | Upper Cretaceous |
| Raton Formation (Coal) | The Raton Formation is as much as 1,600-ft thick and is composed principally of light-gray to buff sandstone with subordinate amounts of carbonaceous shale and coal. The net coal isopach thickness of the unit is in the range of 10 to 140 ft. The Raton Formation was deposited in a fluvial setting. | Early Paleocene to Latest Cretaceous |
| Red Cave Member | Fine-grained, orange to tan or light gray sandstone, which in southeastern Colorado includes interbeds of anhydrite and dolomite | Permian |
| Richards Sandstone | Consists of gray, bioturbated, muddy sandstones and sandy mudstones, burrowed and non-burrowed, cross-stratified sandstones and interbedded mudstones | Upper Cretaceous |
| Saltwash Member | Lower member of Morrison Formation. Lenticular light gray, fine-grained, calcareous sandstone, sandy siltstones, interbedded claystone and occasional thin bedded dense limestone | Upper Jurassic |
| Sanastee Sandstone | Basal transgressive marine sands within the lowermost Niobrara Formation. Equivalent to the Tocito Sandstone that is productive in the Chipeta Field in Montezuma County | Upper Cretaceous |
| Shannon Member | A deltaic and paralic sequence of sands and shales within the Pierre Shale that are productive in several fields on the west flank of the Denver Basin | Upper Cretaceous |
| Shawnee Group | Marine shelf sequence consisting of interbedded limestones, sandstones, and gray shales | Upper Pennsylvanian (Virgilian Series) |
| Shinarump Sandstone Member | Red shale, coarse-grained to conglomeratic sandstone and quartz pebble conglomerate | Middle Triassic |
| Skull Creek Shale Member | The Skull Creek Shale Member of the Dakota Group is composed of interbedded siltstones and shales with some local sandstones. | Lower Cretaceous |
| Spergen Formation | The Spergen Formation of southeastern Colorado is composed principally of highly burrowed, dolomite mudstones and bryozoan, crinoidal wackstones with less abundant mixed skeletal, crinoidal packstones and grainstones. | Mississippian (Meramecian Series) |

| Formation | Description | Age |
|--------------------------------------|--|--|
| St. Genevieve Limestone | Composed of white- to buff and fine sandy and oolitic limestone | Mississippian (Meramecian Series) |
| St. Louis Formation | The St. Louis Formation of southeastern Colorado is lithologically highly variable and contains abundant oolitic and mixed-skeletal lime grainstones, interclast packstones, sandy wackstones and algal-laminated dolomite mudstones. West of the axis of the Las Animas Arch the sandy carbonate facies change to fine- to a coarse-grained sandstone facies. | Mississippian (Meramecian Series) |
| Sundance Formation | Light gray to gray-green glauconitic sandstone | Middle Jurassic |
| Sussex Sandstone Member | A paralic sand and shale sequence within the Pierre Shale that is productive in several fields on the west flank of the Denver Basin | Upper Cretaceous |
| Tertiary Volcanics (Del Norte field) | Igneous sill of andesitic composition | Tertiary |
| Tocito Sandstone | Basal transgressive marine sands within the lowermost Niobrara Formation. Equivalent to the Sanastee Sandstone that is productive in the Ignacio Blanco field in La Plata County. | Upper Cretaceous |
| Topeka Limestone | Marine shelf sequence consisting of interbedded limestone, gray shale, and sandstone | Upper Pennsylvanian (Virgilian Stage) |
| Trinidad Sandstone | The main body of the Trinidad Sandstone is clay-filled, burrowed, low-angle cross stratified, fine-grained sandstone indicative of delta-front deposition. Overlying the main body of the Trinidad Sandstone is a porous fine- to medium-grained distributary channel sandstone sequence. | Upper Cretaceous |
| Vermejo Formation (Coal) | The Vermejo Formation is as much as 550-ft thick and is composed principally of gray, dark gray, and black carbonaceous shales with subordinate amounts of sandstone and coals. The net coal isopach thickness of the unit is in the range of 10 to 45 feet. The Vermejo Formation was deposited in a lagoonal setting. | Upper Cretaceous |
| Wabaunsee Group | Marine shelf sequence consisting of interbedded limestones, sandstones, and gray shales | Upper Pennsylvanian (Virgilian Stage) |
| Warsaw Formation | The Warsaw Formation of southeastern Colorado is comprised of dolomitic mudstones and wackstones and crinoidal, bryozoan lime grainstones | Mississippian (Meramecian Series) |
| Wasatch Formation | Consists of alternating varicolored shale, mudstone, and lenticular sandstone. Depositional environments of the nonmarine Wasatch were alluvial, paludal, lacustrine, and fluvial. | Tertiary (Paleocene and Eocene Epochs) |

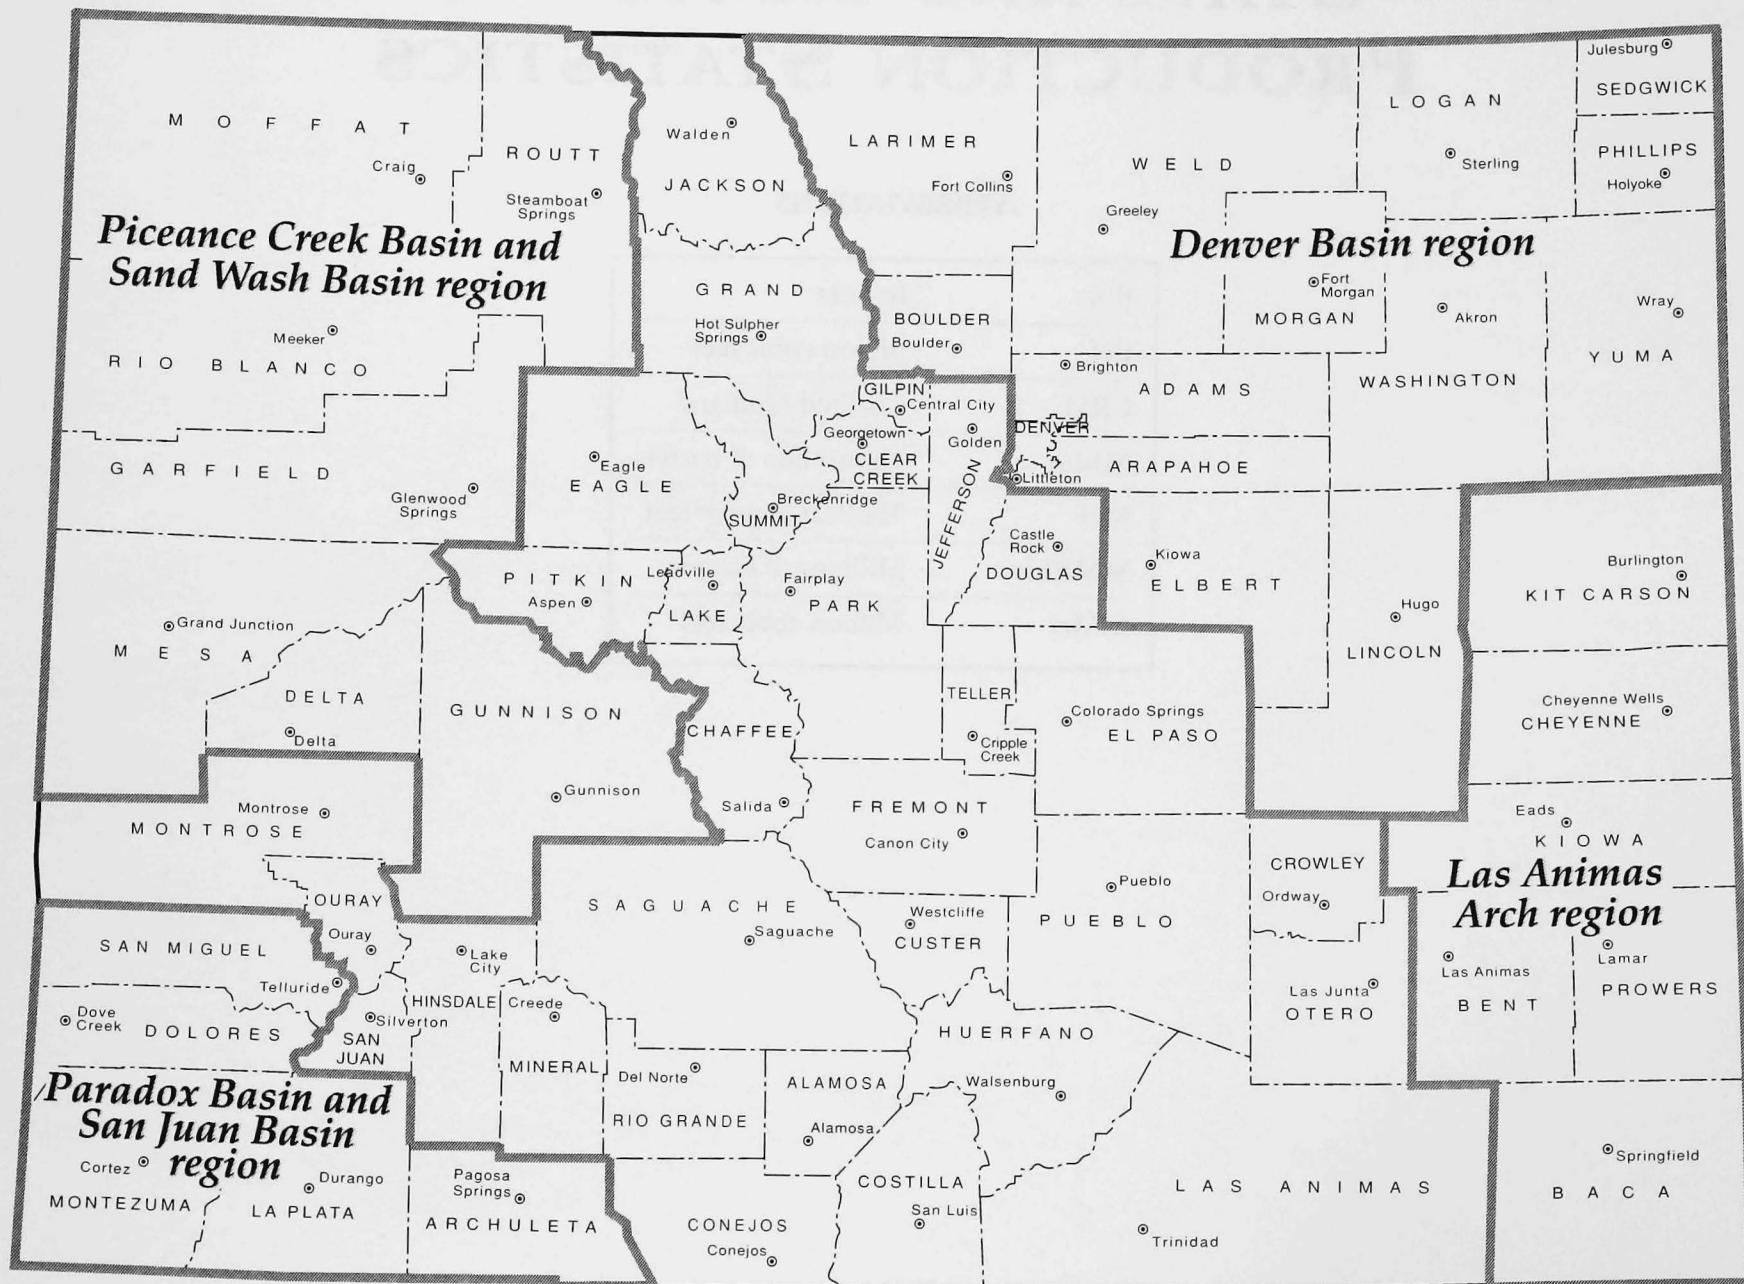

| Formation | Description | Age |
|-------------------|--|--|
| Weber Sandstone | Very light gray to white, fine- to medium-grained, siliceous sandstone with occasional thin limestone beds. The sands are subarkosic to quartz arenite and are of eolian origin. | Middle Pennsylvanian and Lower Permian |
| Wingate Sandstone | Reddish-brown, well-sorted, quartzose sandstone. Eolian origin | Triassic |

STATE AND REGIONAL PRODUCTION STATISTICS

ABBREVIATIONS

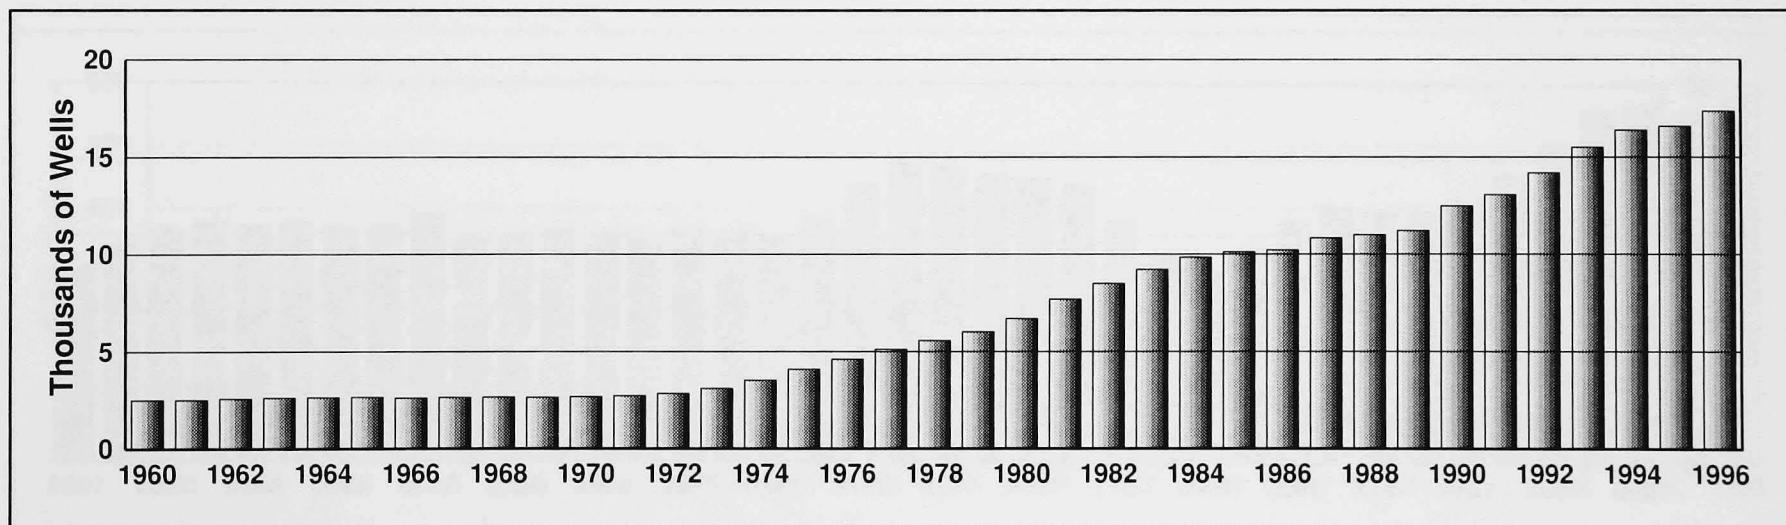

| | |
|--------|----------------------|
| Bbls | Barrels |
| Bcf | Billion cubic feet |
| CBM | Coalbed Methane |
| MBbls | Thousands of barrels |
| Mcf | Thousand cubic feet |
| MMBbls | Millions of barrels |
| MMcf | Million cubic feet |

| 24 | Price Gramps | Archuleta | 6,811,770 |
| 25 | Rush Willadel | Washington | 6,532,948 |

COLORADO'S 25 LARGEST NATURAL GAS FIELDS*

| County Rank | Field Name | County with Major Component Of Field's Production | Cumulative Field Production (Incl. Coalbed Methane) (McF) |
|-------------|---------------------|---|---|
| 1 | Ignacio Blanco | La Plata | 2,112,465,067 |
| 2 | Wattenberg | Weld | 1,406,991,503 |
| 3 | Powder Wash | Moffat | 251,476,363 |
| 4 | Piceance Creek | Rio Blanco | 238,253,352 |
| 5 | Dragon Trail | Rio Blanco | 237,562,604 |
| 6 | Hiawatha | Moffat | 223,541,747 |
| 7 | Hiawatha West | Moffat | 127,935,615 |
| 8 | Barker Dome | La Plata | 111,379,781 |
| 9 | Sugar Loaf | Moffat | 74,863,166 |
| 10 | Lower Horse Draw | Rio Blanco | 67,896,049 |
| 11 | Rulison | Garfield | 61,490,401 |
| 12 | McClave | Kiowa | 61,384,063 |
| 13 | Divide Creek | Mesa | 59,429,432 |
| 14 | South Canyon | Garfield | 56,918,454 |
| 15 | Parachute | Garfield | 47,692,201 |
| 16 | Douglas Creek | Rio Blanco | 47,496,259 |
| 17 | Grand Valley | Garfield | 46,967,942 |
| 18 | Douglas Creek North | Rio Blanco | 46,844,332 |
| 19 | Hambert | Weld | 43,152,949 |
| 20 | Cathedral | Rio Blanco | 39,918,078 |
| 21 | Eckley | Yuma | 36,901,262 |
| 22 | Beecher Island | Yuma | 33,276,709 |
| 23 | Alkali Gulch | La Plata | 32,258,348 |
| 24 | Waverly | Yuma | 31,709,384 |
| 25 | Vilas | Baca | 31,705,595 |

*Individual fields whose gas-oil ratio (GOR) exceeds 6,000 standard cubic feet per stock tank barrel (SCF/STB) are classified as gas fields. Fields with GORs less than 6,000 SCF/STB are classified as oil fields

PRODUCTION STATISTICS BY COUNTY AND FIELD

| County and Field Name | General Location | Year Discovered/ Abandoned | No. Wells Currently and/or Capable of Producing | Producing Formation | Cumulative Reservoir Production to 12/96 Oil (Barrels) | Cumulative Reservoir Production to 12/96 Gas (Mcft) | Cumulative Field Production to 12/96 Oil (Barrels) | Cumulative Field Production to 12/96 Gas (Mcft) | Wells Plugged and Abandoned |
